Chapter 1. About the Document

This document contains information about a very basic application called Just Plain Calculaer (JPC). It can be used by any one who wants to:

- Learn the concept of the mathematical calculations (addition, subtraction, multilplication and devision).
- Use the JPC application to add, subtract, multiply and divide the numbers.

Chapter 2. Product Overview

JPC is a mobile/desktop application used to carry out the following mathematical calculations:

- Addition
- Subtraction
- Multiplication
- Division
- Percentage
- Square root

You can use this application instead of manually calculating the numbers. This saves a lot of time and effort, thus enhancing the productivity.

Chapter 3. Addition

What is Addition of Numbers

Addition is a type of mathematical calculation which is used to find the total quantity of something when they are counted together. + is the symbol for addition.

If you want to add two numbers, write the calculation as "1st number" + "2nd number" = "result".

Suppose you have 2 chocolates in hand and you pick 3 more chocolates from the chocolate jar. Now you want to know how many chocolates are in hand. Then, you want to add 2 and 3. So you should follow the below process:

1. Write the numbers in a single line with + in between them; $2 + 3 = ?$
2. Count 3 numbers which comes after 2; 3, 4 and 5.

So, the result is "5".

How to Add using JPS Calculator

Follow the below steps to add two or more numbers using the JPS Calculator.

Make sure that you know what is addition and its symbol.

1. Open the JPS Calculator.
2. Enter the numbers that you want to add with the + symbol between them.
3. Press = to see the result.

You can see a single number on the JPS Calculator screen. This number is the result.

Enter $2 + 2 + 5 + 8$ and press =. You can see 17 on the JPS Calculator screen.

Chapter 4. Subtraction

What is Subtraction of Numbers

Subtraction is a type of mathematical calculation which is used to find the quantity of something left in a lot, after some of it is removed from the lot. - is the symbol for addition.

If you want to subtract two numbers, write the calculation as "1st number" - "2nd number" = "result".

Note:

Usually, the 1st number is greater than the 2nd number in the process of subtraction.

Suppose you have 3 chocolates in hand and you put 2 chocolates back in the chocolate jar. Now you want to know how many chocolates you have in hand. Then, you want to subtract 2 from 3 (as you removed 2 out of 3 chocolates). So you should follow the below process:

1. Write the numbers in a single line with - in between them; $3 - 2 = ?$
2. Count 2 numbers which comes before 3 backwards; 2 and 1.

So, the result is "1".

How to Subtract using JPS Calculator

Follow the below steps to subtract two or more numbers using the JPS Calculator.

Make sure that you know what is subtraction and its symbol.

1. Open the JPS Calculator.
2. Enter the numbers that you want to subtract with the - symbol between them.
3. Press = to see the result.

You can see a single number on the JPS Calculator screen. This number is the result.

Enter $100 - 2 - 5 - 8$ and press =. You can see 85 on the JPS Calculator screen.

Chapter 5. Multiplication

What is Multiplication of Numbers

Multiplication is a type mathematical calculation used to find the total quantity of an object when they are arranged in groups of equal quantity. Instead of adding the same number repeatedly, you can use multiplication for a faster and easier calculation. * or $\times$ are the symbols for multiplication.

If you want to multiply two numbers, write the calculation as "1st number" $\times$ "2nd number" = "result". Using this process, you find the total number of objects available in two groups. Refer to [Multiplication Table \(on page 10\)](#) to see the tables from 1 through 25.

Suppose you have three Rs 2 coins and you want to know what is the total amount of you have. Then, you have to multiply 2 and 3 (as there are 3 groups of Rs 2). So you should follow the below process:

1. Write the numbers in a single line with $\times$ in between them; $3 \times 2 = ?$
2. Add 2 three times; $2 + 2 + 2$
3. That equals 6.

Note:

Hence, if you remember $3 \times 2 = 6$, it makes your calculation easier.

So, the result is "6".

How to Multiply using JPS Calculator

Follow the below steps to multiply two or more numbers using the JPS Calculator.

Make sure that you know what is multiplication and its symbol.

1. Open the JPS Calculator.
2. Enter the numbers that you want to multiply with the $\times$ symbol between them.
3. Press = to see the result.

You can see a single number on the JPS Calculator screen. This number is the result.

Enter $100 \times 2 \times 2$ and press =. You can see 400 on the JPS Calculator screen.

Chapter 6. Division

What is Division of Numbers

Division is a type of mathematical calculation which is used to create groups of an object such that, each group has the same quantity of the object. / or $\div$ are the symbols for division.

If you want to divide a number, write the calculation as "1st number" $\div$ "2nd number" = "result". Using this process, you find the number of objects in each group and the number of it which can not be divided equally.

- Dividend : 1st number (The total number to be divided).
- Divisor : 2nd number (The number of groups).
- Quotient : Result (The number of items in each group)
- Remainder : The amount left over object (if the number cannot be divided equally)

Note:

The dividend is always greater than the divisor in the process of division.

Suppose you have 6 chocolates in hand and you want to give them to 2 of your friends, so that your friends get the same number of chocolates. Then, you have to divide 6 by 2 (as you create 2 groups out of 6 chocolates). So you should follow the below process:

1. Write the numbers in a single line with $\div$ in between them; $6 \div 2 = ?$
2. Give one chocolate to each of your friends. Do the same till you have no chocolate with you.
3. You can see that there are 3 chocolates with each of your friends.

So, the result is "3".

How to Divide using JPS Calculator

Follow the below steps to divide two or more numbers using the JPS Calculator.

Make sure that you know what is division and its symbol.

1. Open the JPS Calculator.
2. Enter the numbers that you want to divide with the $\div$ symbol between them.
3. Press = to see the result.

You can see a single number on the JPS Calculator screen. This number is the result.

Enter $100 \div 2 \div 2$ and press $=$. You can see 25 on the JPS Calculator screen.

Chapter 7. Multiplication Table

Multiplication Table

Table 1. Table

1	2	3	4	5
$\times 1 = 1$	$\times 1 = 2$	$\times 1 =$	$\times 1 =$	$\times 1 =$
